

Real-Time DevOps Corporate Workflow

[Click Here To Enrol To Batch-6 | DevOps & Cloud DevOps](#)

In today's fast-paced tech landscape, having an efficient and secure DevOps workflow is crucial for delivering high-quality software at speed. Here's an insight into a real-time DevOps corporate workflow, showcasing how various tools and processes integrate to ensure seamless development, deployment, and monitoring.

1. **Infrastructure as Code (IaC):**

- **GitHub** for version control of IaC code.
- **Terraform** to provision infrastructure on **Amazon EKS**.
- **Ansible** for configuration management across Linux servers.

2. **CI/CD Pipeline:**

- **GitHub** for project code repository.
- **Jenkins** to automate builds and deployments.
- **Code Scanning** tools like **Trivy** for vulnerability scanning.
- **SonarQube** for code quality checks.
- **Automated Testing** to ensure robust software releases.

3. **Continuous Monitoring:**

- **Prometheus** and **Grafana** for real-time application monitoring.
- **Alert Manager** to notify the team about any issues.
- **Blackbox Exporter** to monitor app URLs.

4. **Security and Compliance:**

- **Trivy** and other security tools to maintain secure code throughout the pipeline.
- Regular code reviews and compliance checks integrated into the CI/CD process.

5. **Collaboration and Communication:**

- **Jira** for issue tracking and project management.
- **Confluence** for documentation.
- **Email Notifications** to keep the team informed about deployment statuses and issues.

6. **Deployment Management:**

- Real-time dashboards for **DevOps Check** and **Back Management**.
- Deployment to **Amazon EKS** for scalable and managed Kubernetes services.

This integrated workflow not only accelerates the development cycle but also ensures that the software is secure, reliable, and efficiently monitored in real-time.
